## **DETAILED ACTION**

1. This office action is in response to amendment filed April 26, 2005.

- 2. Claims 2, 6 have been canceled.
- Claims 16-22 have been added.

## Response to Arguments

4. Applicant's arguments with respect to claims 1, 3-5, and 7-15 have been considered but are most in view of the new ground(s) of rejection.

## Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1, 4-5, 7, and 12-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Iseyama (5,787,346) in view of Toskala et al. (6,650,905).

Regarding claim 1, 16, 19, Iseyama discloses a radio channel assignment method, comprising the steps of: sending signals from the wireless unit to said wireless communications system via an uplink control channel associated with the shared downlink data channel,; waiting for an indication from the wireless communication system to switch to said new base station (see col.15, lines 46-53, fig.5, element 18, 11, 12, 18, fig.11, steps 3, 21, and its description); receiving downlink data from said previous base station via the shared downlink data channel until said indication (see fig.5, elements 11, 12, fig.11, steps 3 and its description); and switching to said new

base station in response to said indication to switch to said new base station (see col.20, line 66-col.21, line 31, fig.11, 19 and its description), except for the signals indicate an identity of said new base station. However, Toskala discloses a telecommunication comprising the signals indicate an identity of said new base station that the wireless unit has selected from which to receive downlink data (figs.10-11, elements 10, 14, 16, 18, 52, 60 and its description). Therefore, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the Iseyama's system with the teaching of Toskala of sending signals indicate an identity of said new base station in order to select the preferred base station and also desirable to reduce interference in cellular networks.

Regarding claims 4-5, 7, 12-15, 17-18, and 20-22, Iseyama further wherein said step of receiving comprises the step of: receiving downlink data from said previous base station until an indication from said previous base station that data for said wireless unit at said previous data has been sent (see fig.11, steps 1, 10, 10', 2, fig. 32, and its description).

7. Claims 3, and 8-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Iseyama (5,787,346) in view of Padovani et al. (6,574,211).

Regarding claims 3 and 8, Iseyama discloses all the subject matter described in rejected claim 1, except for sending downlink data rate information. However, Padovani teaches sending downlink data rate information (abstract, col. 14 lines 21-61). Therefore, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the Iseyama's system with the teaching of Padovani of

Application/Control Number: 09/973,399

Art Unit: 2683

sending data rate information in order to select the new base station for sending and receiving the data information at the appropriate rate from the serving base station.

Regarding claim 9, Iseyama discloses all the subject matters described in rejected claims 1 and 7, except for the signals sent comprise a Walsh code, and wherein the sending step comprises spreading the signals in the uplink control channel such that only the new base station receives the signals from the wireless unit.

However, Padovani teaches the signals sent comprise a Walsh code (col. 14 lines 54-61), and wherein the sending step comprises spreading the signals (col. 31 lines 54-65) in the uplink control channel such that only the new base station receives the signals from the wireless unit. Therefore, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the Iseyama's system with the teaching of Padovani et al. of sending signals with Walsh code and spreading the signal in order to the new base station is able to identify the mobile station that will receive the data.

8. Claims 10-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Iseyama (5,787,346) in view of Forssell et al. (EP 1059 820 A2).

Regarding claim 10, Iseyama discloses all the subject matters described in rejected claim 1, except for the indication comprises an indication message that is sent to the previous base station indicating that data packets are ready to be sent to the new base station. However, Forssell teaches wherein the indication comprises an indication message that is sent to the previous base station indicating that data packets are ready to be sent to the new base station (col. 14 lines 39-56). Therefore, it would have been

obvious to one ordinary skilled in the art at the time the invention was made to modify the Iseyama's system with the teaching of the Forssell of the indicating message is sent to the previous base station in order to the mobile station to switch over to the new base station and to receive the remaining data after handoff.

Regarding claim 11, Forssell et al. further discloses a method as claimed in claim 10, wherein the indication message is an end of data signal indicating that the receiving step has received all data from the previous base station (col. 14 lines 39-56).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CongVan Tran whose telephone number is 571-272-7871. The examiner can normally be reached on Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Trost can be reached on 571-272-7872. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
